SUMMARY

I build multi-tenant SaaS products end to end: Node.js APIs on PostgreSQL or Firestore, React Native and Flutter apps, payments with Razorpay and AI features with Google Gemini. Four products I worked on are live in production. Open to relocation, visa sponsorship needed.

EXPERIENCE

Full Stack Developer, Tamilarasi Technologies Pvt Ltd Oct 2024 to present
Chennai, India

- Build features end to end across four live SaaS products: data models, Node.js APIs, React Native, Flutter and web front ends, and deployment.
- Work on Razorpay payment flows: orders, signature-verified webhooks, per-card billing and payment fixes.
- Build generative AI features with Google Gemini: content suggestions and scanning paper visiting cards into digital cards.
- Trace production defects from logs to root cause and verify each fix against existing business rules.

SELECTED PROJECTS

RentEasify Rental management SaaS
My part: The Expo association (RWA) app, the commercial app, and backend services for leases, billing, KYC and agreements.

- Built much of the Expo association (RWA) app, which replaces the legacy web app screen by screen: units, owners, tenants, leases, team, settings and reports, move-in and move-out checklists, owner import from a unit sheet, and association registration.
- Built features in the commercial app for PGs and commercial properties: QR onboarding, property and complex detail, branch payments, offline payment approval and House Rules AI.

renteasify.com web.renteasify.com

SociBooks Society accounting SaaS
My part: Ledger, income, expense-approval, invoice and statement features across the API and committee app, and the owner screens.

- Moved the API's database access to Prisma and built much of the income, payment and expense modules, including expense categories and committee-vote approval.
- Built the statement of account and invoice PDFs, invoice templates and the opening-balance flow (manual entry and CSV).

socibooks.com committee.socibooks.com

DigiVCards.ai Digital business card SaaS
My part: Flutter and Expo app features, the admin console redesign, AI card scanning and content, and payment fixes.

- Built features in the Flutter mobile app: onboarding, OTP sign-in, cards, products and services, payments and localisation.
- Built screens in the Expo app that replaced it: the public card, who viewed my card, members, OTP resend, paywall and pricing.

digivcards.ai web.digivcards.ai

Kalaivani ERP School management platform
My part: School admin Flutter app features: dashboard and setup, shared school switching, and transport screens.

- Built features in the school admin Flutter app, my main area: dashboard, setup progress and profile screens.
- Split the mobile app into admin and public versions with role-based access.
